

Freckles, volcanoes and rivers: channelisation in the industrial and scientific world

By: Dr A.C. Fowler, MACSI, University of Limerick

Abstract

Perhaps the most important attribute of the applied mathematician is to see connections between subjects which are apparently very different. In this talk I will illustrate this by drawing parallels between the phenomena of freckle formation in solidifying alloys, the formation of volcanic conduits from the deep Earth, and the formation of river networks, and will mention other similar phenomena.
