

Integration Worksheet: Solutions

1.

Use the formula $\frac{d}{dx} \int_a^{g(x)} f(t) dt = f(g(x)) \cdot g'(x)$

Here we have

$$\begin{aligned} f(t) &= \sqrt{\tan^2 t + e^t}, \\ g(x) &= x^2, \\ g'(x) &= 2x. \end{aligned}$$

Thus

$$\frac{d}{dx} \int_1^{x^2} \sqrt{\tan^2 t + e^t} dt = 2x \sqrt{\tan^2(x^2) + e^{x^2}}. \quad (\text{iv})$$

2. Evaluate the following integrals.

(i) Use table 37 with $m = n = 1$.

$$\begin{aligned} \int \sin^m x \cos^n x dx &= \frac{\sin^{m+1} x \cos^{n-1} x}{m+n} + \frac{n-1}{m+n} \int \sin^m x \cos^{n-2} x dx + c \\ \int \sin^1 x \cos^1 x dx &= \frac{\sin^2 x \cos^0 x}{2} + 0 \times \int \sin^1 x \cos^{-1} x dx + c \\ &= \frac{\sin^2 x}{2} + c \end{aligned}$$

(ii) Use table 16 with $a = 2, b = 1$.

$$\begin{aligned} \int \frac{x}{\sqrt{ax+b}} dx &= \frac{2ax-4b}{3a^2} \sqrt{ax+b} + c \\ \int \frac{x}{\sqrt{ax+b}} dx &= \left(\frac{4x+4}{12} \right) \sqrt{2x-1} + c \\ &= \left(\frac{x+1}{3} \right) \sqrt{2x-1} + c \end{aligned}$$

(iii)

Make the substitution $u = 4 - x^2$
Then $du = -2x dx$

The limit $x = 0$ becomes $u = 4$. The limit $x = 2$ becomes $u = 0$.

$$\begin{aligned} \int_0^2 x \sqrt{4-x^2} dx &= -\frac{1}{2} \int_4^0 -2x \sqrt{4-x^2} dx \\ &= -\frac{1}{2} \int_4^0 u^{1/2} du \\ &= -\frac{1}{2} \left[\frac{2}{3} u^{3/2} \right]_4^0 \\ &= -\frac{1}{3} [u^{3/2}]_4^0 \\ &= -\frac{1}{3} [0 - (4)^{3/2}] \\ &= \frac{8}{3} \end{aligned}$$

Make the substitution $u = 5x - 1$

$$\begin{aligned} \text{Then } du &= 5dx \\ \int \frac{3}{5x-1} dx &= \frac{3}{5} \int \frac{5}{5x-1} dx \\ &= \frac{3}{5} \int \frac{du}{u} \\ &= \frac{3}{5} \ln|u| + c \\ &= \frac{3}{5} \ln|5x-1| + c \end{aligned}$$

(v)

Make the substitution $u = \tan x$ Then $du = \sec^2 x dx$ The limit $x = 0$ becomes $u = 0$. The limit $x = \frac{\pi}{4}$ becomes $u = 1$.

$$\begin{aligned} \int_0^{\pi/4} \tan x \sec^2 x dx &= \int_0^1 u du \\ &= \left[\frac{u^2}{2} \right]_0^1 \\ &= \frac{1}{2} \end{aligned}$$
